Abstract
Every educational institution has a standard process for scheduling courses. In scheduling, there are a lot of constraints that must be fulfilled, including hard and soft constraints. Hard constraints are constraints that must be met and cannot be disregarded; a lecturer, for instance, is limited to teaching one course in one room at a time. Soft constraints, on the other hand, are a type of restriction that can be broken, but breaks are minimized to the greatest extent possible.

The aim of this research is to produce an optimal lecture schedule and to provide alternative solutions. The case study taken is the even semester at Institut Teknologi Sumatera (ITERA) Mathematics Study Program. The problem is modelled using Goal Programming and solved using LINGO. The result shows that the scheduling can fulfill every requirement.

Keywords: scheduling, hard constraint, soft constraint, goal programming

1. INTRODUCTION

Scheduling is one of the important aspects of a study program of a university. Class scheduling is a routine activity at the beginning of the semester that must be carried out by each study program. In making class schedules, various problems were encountered, such as limited space, the number of rooms that can be used to organize lectures, limited space capacity, limited teaching hours for lecturers, and others [1]. The more courses will be scheduled, the more difficult the problem is faced. In designing a schedule for classes offered on a study program, there are constraints that must be fulfilled and cannot be violated, and those constraints are called hard constraints; for example, a course at time t1 given by lecturer A in room R1, then lecturer A cannot teach at time t1 for other courses and room R1 cannot be used by other lectures at time t1, and so on. In addition to hard constraints, there are some soft constraints [2]. These types of constraints may not be fulfilled. However, these violations should be made at the minimum as possible. Time preference for lectures is one example of these constraints.

Some researchers have investigated the class scheduling problems, such as Suhartono who used Genetics Algorithms to optimize the computer laboratory in AMIK JTC Semarang [3], and Ruhiyat et al, who used Goal Programming to minimize the overlapping schedule programs FMIPA IPB [4].

In the Mathematic Study Program of Institut Teknologi Sumatera, the class scheduling process is still done manually, and frequently the violation of hard constraints occur, and usually the violations are fixed after a series of revisions made to the schedule. In this research we developed a mathematical model for that problem using goal programming and then solved the problem using LINGO.

2. THE METHOD

Scheduling is ordering or sequencing items in a way that best achieves a set of goals while adhering to a set of constraints, or allocation of resources to objects being put in space-time, subject to limitations [5]. In scheduling, the following are some of the difficult constraints:
- A lecturer can not teach more than one course/class at the same time.
- A course for students at the same level and the same major cannot be scheduled at the same time.
- A classroom for a certain time can only be used for one class, and cannot use the same room for more than one class.
- The capacity of the classroom must be able to cover the number of students.
- Some classes/courses need a specific room, for example, a computer laboratory.
The soft constraints are 'preferable' constraints which may be violated. Some constraints below are some of the soft constraints for class scheduling:

- Lecturers' preference to teach at a specific time, specific day
- The class, which has 4 credit units, may be split into 2 times; each consists of 2 credits
- It is better for every lecturer to have a day off during a weekday so that he has a 'free' day so that he can manage it to improve the quality of teaching materials or other academic activity on campus.

In reality, it is hard to satisfy all soft constraints. The quality feasible schedule is a schedule that not only satisfies hard constraints, but also soft constraints. However, it is acceptable if some soft constraints are violated, as long as the violations should be made at as minimum as possible.

In order to have a solution that can handle those two kinds of constraints, goal programming can be used. Goal programming is one method that can be used to solve a multi-objective linear programming. The procedure for modelling a problem using goal programming is as follow [6]:

a. Determine decision variable. Determining decision variables is the most important step. The more precise the decision variable is, the more accurate the model.

b. Determine the constraints.

c. Determine the priority

d. Determine the weight

e. Determine the objective

f. Non negativity

The multi-objective linear programming can be defined as follows:

\[
\begin{align*}
\text{Min } z_1(x) &= c_1x \\
\text{Min } z_2(x) &= c_2x \\
\text{Min } z_k(x) &= c_kx \\
\text{Subject to: } Ax &\leq b, \\
x &\geq 0
\end{align*}
\]

Goal programming method can be used to solve the multi-objective linear programming. In order to use goal programming, the problem must be transformed to a goal programming model, and then define what the goal is, and also add the deviation variables to the goal. In the next section we will discuss how we model the class scheduling using goal programming and then solve the model using LINGO 18.0.

### 3. RESULTS AND DISCUSSION

In this section we will discuss how to formulate the class scheduling using an integer programming model, put it into goal programming model, and then solve it. The data used is data on the even semester 2020-2021 in the mathematics study program at Institut Teknologi Sumatera (ITERA). The data consists of data lecturers, parallel classes, courses, rooms, days, and time periods of courses.

1. **Courses.**
   
   The courses given in the mathematics study program at ITERA consist of compulsory and elective courses. The compulsory courses must be taken by students, while elective courses are not. The credits for each course are 3 Semester Credit Units (SCU). The time for giving the lecturer is 50 minutes for each SCU. Most of the courses given are assigned to be taught by lecturers from ITERA itself. However, some courses are assigned to be taught by lecturers from other institutions.

2. **Days and time periods.**
   
   The days for giving lectures in ITERA are from Monday through Friday. For the time period, it starts from 7.00 a.m until 15.30 p.m, thus one day only consists of three time periods: 07.00 – 09.30, 10.00-12.30, 13.00 – 15.30. There are thirty minutes between the two time periods. Note that on Friday, there are only two time periods to give time for students and lectures to follow Jum'ah prayer. We use index j for days.

3. **There are 15 lectures in Mathematics Study Program of ITERA, including 3 lecturers from other institutions. The following table shows the lecturer and the course assigned.**

</table>

4. Rooms
There are only three rooms available for class/lectures as shown in the following table:
5. Parallel classes
For even semester of 2020-2021 there are some parallel classes, depending on the number of students and the number of lecturers who can teach the courses. The parallel classes are: 4 parallel classes for Complex Function; 3 parallel classes for Geometry and Discrete Mathematics; 2 parallel courses for Introduction to Differential Equation, Algebraic Structure, Time Series Analysis, Finance Mathematics, Advanced Optimization, and Introduction to Stochastic Process; and no parallel class for Dynamical System, Analysis I, Matrix Theory, Capita Selecta Statistics, Capita Selecta Computation, Capita Selecta Algebra, and Capita Selecta Applied Mathematics.

By using this information, we model the class scheduling for the Mathematics Study Program in ITERA as follows:

i) Index
- \(i\) : course index, \(i=1,2,3,\ldots,16\).
- \(j\) : day index, \(j=1,2,\ldots,5\).
- \(k\) : parallel class index, \(k=1,2,\ldots,4\).
- \(l\) : time period index, \(l=1,2,3\).
- \(m\) : lecturer index, \(m=1,2,3,\ldots,15\).
- \(n\) : room index, \(n=1,2,3\).

ii) Parameters
- \(t_i = \begin{cases} 1, & \text{if } i \text{ is index for compulsory course} \\ 2, & \text{if } i \text{ is index for elective course} \end{cases}\)
- \(s_i = \begin{cases} 4, & \text{if } s_i \text{ is the fourth semester student} \\ 6, & \text{if } s_i \text{ is the sixth semester student} \\ 8, & \text{if } s_i \text{ is the eighth semester student} \end{cases}\)

iii) Sets
- \(A\) = set of courses taught at even semester at Mathematics Study Program, ITERA.
- \(B\) = set of the days where the courses taught.
- \(C\) = set of parallel classes with four classes
- \(D\) = set the time periods
- \(E\) = set of lecturers
- \(F\) = set of rooms for teaching activities.
- \(G\) = set of compulsory courses
- \(T_1\) = set of courses for fourth semester students.
- \(T_6\) = set of courses for sixth semester students.
- \(T_8\) = set of courses for eighth semester students.
- \(Q\) = set of parallel classes with three classes
- \(R\) = set of parallel classes with two classes
- \(S\) = set of nonparallel classes
- \(AE_m\) = set pf courses taught by lecturer \(m\).

Note that \(G \subseteq A, T_1 \subseteq A, T_6 \subseteq A, T_8 \subseteq A\)

iv) Decision variable:
\[x_{i,j,k,l,m,n} = \begin{cases} 1, & \text{if course } i \text{ is scheduled for day } j \text{ for class } k \text{ on time period } l, \text{taught by lecturer } m \text{ in room } n \\ 0, & \text{for others} \end{cases}\]

v) Deviation Variable
vi) Set of Constraints

a. Hard Constraints

The hard constraints are constraints that must be fulfilled and cannot be violated which are:

1. The number of scheduled courses for a week is 29

\[ \sum_{i \in A} \sum_{j \in B} \sum_{k \in E} \sum_{l \in C} \sum_{m \in F} x_{i,j,k,l,m,n} = 29 \]

2. The compulsory course cannot be scheduled at the same time period on the same day.

\[ \forall j \in B, l \in D, \sum_{i \in A} \sum_{k \in E} \sum_{m \in F} x_{i,j,k,l,m,n} \leq 1, \quad \text{where } G = \{ i | s=4 \text{ and } s=6, \ t=1 \} \]

3. All courses for fourth, sixth, and eighth semester cannot be scheduled at the same day and the same time period

   a. For fourth semester students

   \[ \forall j \in B, l \in D, \sum_{i \in A} \sum_{k \in E} \sum_{m \in F} x_{i,j,k,l,m,n} \leq 1, \quad \text{where } T_1 = \{ i | s=4, \ t=1 \} \]

   b. For sixth semester students

   \[ \forall j \in B, l \in D, \sum_{i \in A} \sum_{k \in E} \sum_{m \in F} x_{i,j,k,l,m,n} \leq 1, \quad \text{where } T_2 = \{ i | s=6, \ t=2 \} \]

   c. For eighth semester students

   \[ \forall j \in B, l \in D, \sum_{i \in A} \sum_{k \in E} \sum_{m \in F} x_{i,j,k,l,m,n} \leq 1, \quad \text{where } T_3 = \{ i | s=8, \ t=3 \} \]

4. Every course is scheduled exactly on one day, one room and one time period

\[ \forall i \in A, k \in C, \sum_{j \in B} \sum_{l \in D} \sum_{m \in F} x_{i,j,k,l,m,n} \leq 1 \]

5. Every room in every time period only can be used by one course

\[ \forall j \in B, l \in D, n \in F, \sum_{i \in A} \sum_{k \in E} \sum_{l \in D} \sum_{m \in F} x_{i,j,k,l,m,n} \leq 1 \]

6. Every lecture only can teach one course at a certain room, certain day, and a certain time period

\[ \forall j \in B, l \in D, m \in E, \sum_{i \in A} \sum_{k \in E} \sum_{l \in D} \sum_{m \in F} x_{i,j,k,l,m,n} \leq 1 \]

7. There are three lectures from other institution who only can teach on a certain day and certain time

   1. Introductory Differential Equation only can be held twice on Tuesday, from 07.00 a.m until 15.30 p.m

   \[ \sum_{k \in E} \sum_{l \in D} \sum_{m \in F} x_{i,j,k,l,m,n} = 2 \]

   2. Geometry only can be held on Monday or Friday, three times, from 07.00 a.m until 15.30 p.m

   \[ \sum_{k \in E} \sum_{l \in D} \sum_{m \in F} x_{i,j,k,l,m,n} + x_{i,j,k,l,m,n} = 3 \]

   3. Analysis I only can be held once a week, on Monday or Friday, from 07.00 a.m until 12.30 pm, because that
time period is used for Jum‘ah prayer.
- \( \sum_{i \in A} \sum_{k \in E} \sum_{m \in E} \sum_{n \in N} x_{i,j,k,l,m,n} = 0 \)

9. Every lecturer teaches courses accordance to his expertise
- For \( m = 1 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} = 1 ; A_E = \{3\} \)
- For \( m = 2 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{12,j,k,l,2,n} = 3 ; A_E = \{9, 13\} \)
- For \( m = 3 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{13,j,k,l,2,n} = 2 ; A_E = \{4, 12, 15\} \)
- For \( m = 4 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{15,j,k,l,3,n} = 3 ; A_E = \{5, \} \)
- For \( m = 5 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{16,j,k,l,3,n} = 2 ; A_E = \{10, 16\} \)
- For \( m = 6 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{10,j,k,l,j,n} = 2 ; A_E = \{1, 2, 8\} \)
- For \( m = 7 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{14,j,k,l,n} = 2 ; A_E = \{11, 14\} \)
- For \( m = 8 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{16,j,k,l,n} = 2 ; A_E = \{5, 7\} \)
- For \( m = 9 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} = 1 ; A_E = \{6\} \)
- For \( m = 10 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{1,j,k,l,10,n} = 2 ; A_E = \{1, 2\} \)
- For \( m = 11 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{6,j,k,l,11,n} = 2 ; A_E = \{7, 6\} \)
- For \( m = 12 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{12,j,k,l,12,n} = 2 ; A_E = \{4, 5\} \)
- For \( m = 13 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{9,j,k,l,13,n} = 1 ; A_E = \{9\} \)
- For \( m = 14 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{11,j,k,l,14,n} = 2 ; A_E = \{2, 8\} \)
- For \( m = 15 \) and \( \forall i \in A_E \)
  \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,j,n} + x_{5,j,k,l,15,n} = 2 ; A_E = \{1, 5\} \)

10. The parallel classes match with the number scheduled lecturers
- The parallel classes with four classes
- For \( i = 5 \), \( \sum_{j \in E} \sum_{k \in E} \sum_{m \in E} x_{5,j,k,l,m,n} = 4 \)
- The parallel classes with three classes
For \( \forall i \in Q \), \( \sum_{j \in E} \sum_{k=1}^{5} \sum_{m \in E} x_{j,k,l,m,n} = 3 \)
- The parallel classes with two classes
For \( \forall i \in R \), \( \sum_{j \in E} \sum_{k=1}^{5} \sum_{m \in E} x_{j,k,l,m,n} = 2 \)
- Non parallel classes
For \( \forall i \in S \), \( \sum_{j \in E} \sum_{k \in E} \sum_{n \in E} x_{j,k,l,m,n} = 1 \)

b. Soft Constraints
1. Every lecturer only teaches maximum two courses at the same day.
   \( \forall j \in B, m \in E \), \( \sum_{i \in A} \sum_{k \in E} \sum_{n \in N} x_{i,j,k,l,m,n} \leq 2 \)
2. A lecturer is not teaching for sequential time period in one day
   \( \forall j \in B, m \in E \), \( \sum_{i \in A} \sum_{k \in E} \sum_{n \in N} x_{i,j,k,l,m,n} \leq 2 \)
3. The number of courses taught for fourth semester students at most 2.
   \( \forall j \in B \), \( \sum_{i \in A} \sum_{k \in E} \sum_{n \in N} x_{i,j,k,l,m,n} \leq 2 \)
4. The number of courses taught for sixth semester students at most 2.
Therefore, using that result we can construct the following table

<table>
<thead>
<tr>
<th>Class</th>
<th>Course</th>
<th>Lecturer</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Geometry</td>
<td>Mira Mustika, S.Si., M.Sc.</td>
</tr>

</tr>
<tr>
<td>B</td>
<td>Time Series Analysis</td>
<td>Tiara Shofi Edriani, M.Si.</td>
</tr>
</tbody>
</table>
teach no more than two classes a day. Courses are more than fourth semester and eighth semester lecture, then the preference to students and also for eighth semester students. For sixth semester students, because the which means that all lecturers teach no more than two classes a day, no lecturers teach on a Wednesday.

From Table 4 we can see that by using no priority (all weights are the same), the schedule satisfies all hard constrained. However, for the soft constraints not all are satisfied, as shown in Table 5. From that table it shows that the first, second, third and fifth goals are satisfied, which means that all lecturers teach no more than two courses a day, no lecturers teach on a two consecutive time periods. The same results for the courses for fourth semester and eighth semester students where there are no more than two courses taught for fourth semester students and also for eighth semester students. For sixth semester students, because the courses are more than four semester and eighth semester lecture, then the preference to teach no more than two classes a day is not satisfied which can be seen on Monday.

<table>
<thead>

</tbody>
</table>

Table 5. The value of deviation

By Solving model (b), using LINGO 18.0 with \( w_1 = 60, w_2 = 40, w_3 = 10, w_4 = 20, w_5 = 10 \), we get the following 29 variables whose value 1: 

\( x_{1,1,1,1,10,3}, x_{1,1,1,2,2,6,1}, x_{1,1,1,5,2,3,15,1}, x_{2,2,1,1,1,1,4,1}, x_{2,2,2,2,2,1,1}, x_{3,1,3,1,1,2,6,3}, x_{3,1,3,1,1,2,6,3}, x_{4,2,3,1,3,14,3}, x_{4,2,3,1,3,14,3}, x_{5,2,3,1,1,1,1,4,1}, x_{5,2,3,1,1,1,1,4,1}, x_{5,3,4,1,12,2}, x_{5,3,4,1,12,2}, x_{6,4,1,2,8,1}, x_{6,4,1,2,8,1}, x_{6,6,2,2,3,9,3}, x_{6,5,1,1,1,1,2} \)
Based on the data of even semester 2020,

\[ x_{7,1,22,11.2}, x_{7,3,1,3.8.2}, x_{8,4,1,2,6.2}, x_{8,5,2,3,14.3}, x_{9,2,2,1,1.2.2}, x_{9,3,1,2,13.2}, x_{10,2,1,2,5.3}, x_{11,1,1,1.7.1}, \\
 x_{12,4,3,3.2}, x_{13,5,1.1,2.1}, x_{14,4,1,3,7.1}, x_{15,2,1,3.3.2}, x_{16,3,1,3.5,1} \]

By using this result we get the following table:

</table>

The result for different weight also produces the schedule which satisfies hard constraints. However, one soft constraint is not satisfied. This result is similar with the model with no priority, where fourth goal has deviation value 5 as shown in Table 5.

4. CONCLUSION

From the results and discussion above we can conclude that the goal programming can be used to solve the class scheduling problems. Based on the data of even semester 2020-2021 in Mathematics
study Program ITERA, for two models designed, both produce a schedule which satisfy hard constraints, and both models also violate the soft constraints with same value of deviation on the fourth goal. This mean that the sixth semester student must have more than two courses in a day.
